Exhibit A: Variety 9321 evolved from a cross of variety MO304-21 X Pioneer experimental variety 3062-23. 3062-23 evolved from a cross of WEBER X A3127. 9321 is an F5 derived variety which was advanced to the F5 generation by modified bulk descent. The F6 progeny row of 9321 was grown in Iowa during the summer of 1989. Subsequently, 9321 has undergone four years of extensive testing and purification and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation, with no evidence of variants.

The breeder seed purification block of 9321 was produced during the summer of 1992 and 100 sublines were bulked for increase. Seven acres of 9321 (breeders seed) were grown in Chile during the winter of 1992. 300 acres of parent seedstock (foundation seed equivalent) were grown during the summer of 1993.

Exhibit B: Variety 9321 is most similar to variety DSR304. Both varieties have purple flowers, light tawny pubescence and yellow seeds. However, 9321 has brown hila whereas DSR304 has black hila.

Exhibit D:

In Exhibit C we have identified 9321 as susceptible to bacterial blight, brown spot, pod and stem blight, rhizoctonia root rot, bud blight, yellow mosaic, cowpea mosaic, pod mottle, and seed mottle. This does not mean that we consider 9321 to be worse than other varieties of similar maturity in reaction to these challenges. Rather, we do not consider 9321 to be immune to them. Therefore, we have chosen to be conservative and have identified 9321 as "susceptible".

Variety 9321 is an early group III variety. If group III maturities are divided into tenths, the relative maturity of 9321 is 3.2.
